- Shear on Common Sections
- Examples

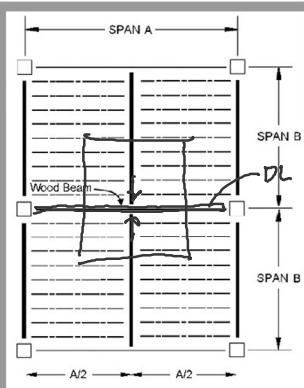

Homework problem – Beam Design

5. Sawn Lumber - Beams

Design the central timber beam shown in the floor system using the given species and grade. Use the given floor D+L load plus the beam selfweight based on the given wood density (moisture is already included). Assume dry conditions (M.C. < 19%) and normal temperatures. Find the timber section with the least area to pass the allowed allowable stress. Finally, calculate the total D+L deflection including creep. Assume 30% of the Live Load is sustained (long-term).

DATASET: 1 -2-

Wood Species	COAST SITKA SPRUCE
Wood Grade	No.2
Span A	19 FT
Span B	16 FT
Dead Load	55 PSF
Live Load	30 PCF
Wood density, D	13.5 IN
actual section width, b	

#	Question	Your Response
1	Tabulated Allow. Bending Stress, F_b	PSI
2	Tabulated Allow. Shear Stress, F_v	PSI
3	Tabulated E modulus, E	PSI
4	Tabulated Emin modulus, E_{min}	PSI
5	Total point load (D+L)	LBS

16	Factored Allow. Bending Stress, F'_b	PSI
17	Factored Allow. Shear Stress, F'_v	PSI
18	Total maximum moment, M_{max}	FT-LBS
19	Total maximum shear force, V_{max}	LBS
20	Actual bending stress, f_b	PSI
21	Actual shear stress, f_v	PSI
22	Deflection from floor DL, P_{DL}	IN
23	Deflection from total floor LL, P_{LL}	IN
24	Deflection from beam selfweight, w_{self}	IN
25	Long-Term deflection x Kcr	IN
26	Short-Term deflection	IN
27	Total deflection (short + long term w/ creep)	IN

Box Beams

APA - 2416T.

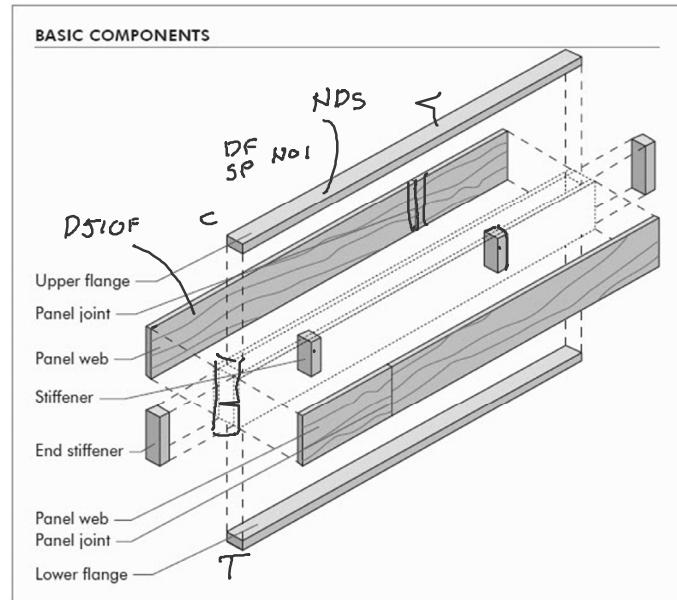

Box beams are built-up beams using dimensioned lumber (2x4 or 2x6) and panels (generally plywood)

The box is framed with the lumber and the sides are skinned with the panels.

The horizontal top and bottom flanges are continuous members as are the vertical ends and internal web stiffeners.

The flanges carry the tension and compression couple (the flexural moment) and the panels carry the shear force.

The internal vertical members brace and stiffen the panels.

Box Beams

Advantages

- low cost – economic alternative to steel or glulam
- good stiffness and strength
- light weight
- minimal shrinkage, warping or twisting
- ease of fabrication
- material availability
- speed of installation
- can be insulated if desired

Box Beam

Laminated Beam

Box Beams

(a) Includes 15% snow loading increase.

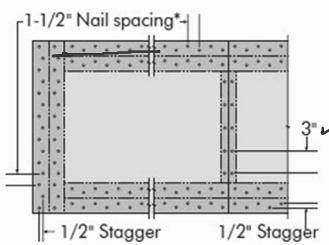

*Lumber may be No. 2 Douglas-fir or No. 2 southern pine without reduction of tabulated capacity.

Box Beams APA design with tables (Z416T 2009)

Table assumptions:

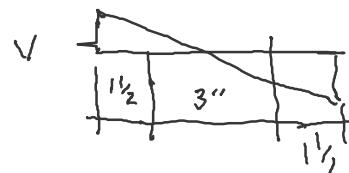

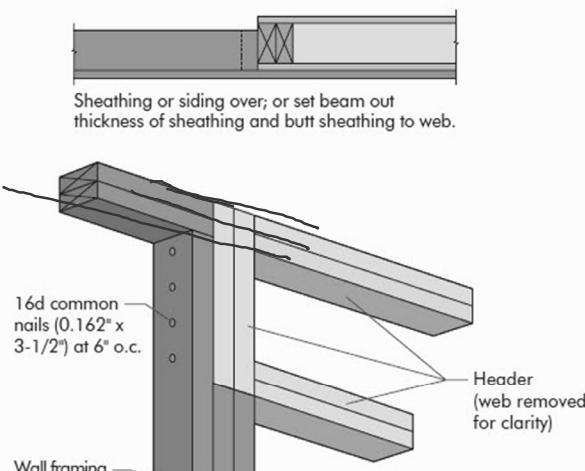

- DF - No1 or SP - No1
- panels: APA – expos. 1 4- or 5-ply or OSB
- deflection less than $L/240$ (total load)
- nail size – 8d common
- nail spacing:
 - flanges $1\frac{1}{2}$ " o.c.
 - may be doubled in middle half of span
 - end stiffeners $1\frac{1}{2}$ " o.c.
 - mid stiffeners 3" o.c.

NAILING LAYOUT

*When end stiffeners extend through the beam, nail spacing is the same as for flanges, except space nails 1 inch on center when double end stiffeners are used in beams with three members per flange (cross-section C). When end stiffeners are inserted between flanges, nails may be spaced 3 inches on center.

Structures I

Slide 7 of 18

Box Beams

Example:

APA Z416T design with tables

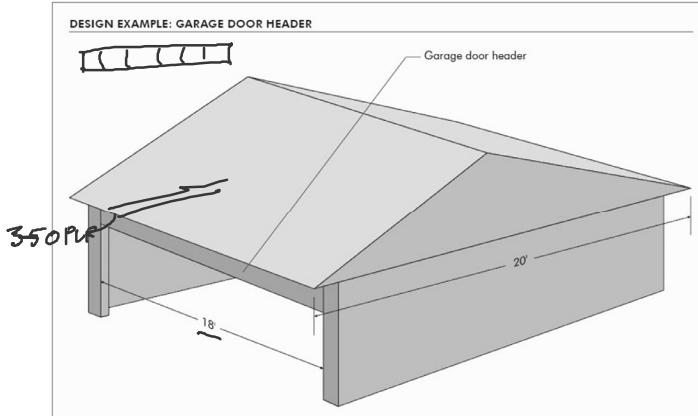

garage door header using 2x4s

span = 18 ft

factored projected roof load = 35 psf
(DL 10 psf + SL 25 psf)

Load on beam:

$$35 \text{ psf} \times 20 \text{ ft} / 2 = 350 \text{ plf}$$

Box Beams

APA design with tables
Example:

Load on beam:

$$35 \text{ psf} \times 20 \text{ ft} / 2 = 350 \text{ plf} + \frac{\text{self}}{45}$$

Choose beam:

follow the 18 ft span column
no 12" or 16" deep sections work
20" with $367 > 350+15$ plf works
or
 $24" \text{ with } 413 > 350+13$ plf works
both options use section "B"

20" deep:

23/32" 48/24 panel and DF No1
or

24" deep:

15/32" 32/16 panel and DF No1

In this case the 24" section uses a
thinner and lower rated panel and so
would be less costly. If the additional
depth were a concern the 20" beam
could be used.

		ALLOWABLE LOADS ^(a) FOR 20-INCH DEEP ROOF BEAMS OR HEADER (lb/ft)

NDS analysis

Based on the previous example
find the maximum load capacity.

Load on beam:

$$D+S = 35 \text{ psf} \times 20 \text{ ft} / 2 = 350 \text{ plf}$$

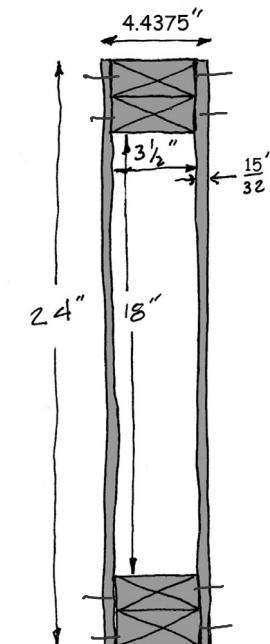

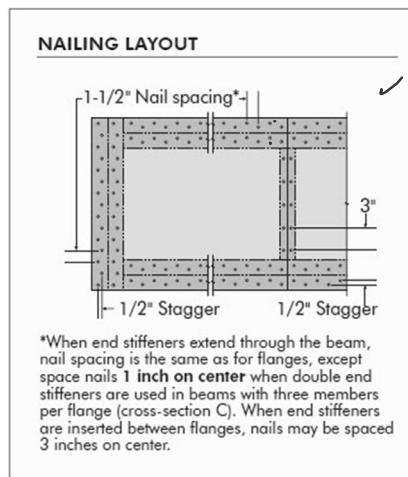

$$C_D = \underline{1.15}$$

Box Beam Section:

- Douglas Fir No1
- $G = \underline{0.5}$

Nails:

- 8d common
- spacing, $s = 1 \frac{1}{2}$ " o.c. flange and ends, 3" o.c. web stiffeners
- rows of nails, $R = 2$ per web per flange (8 total top and bottom)
- allowable load per nail, $F_n = \underline{74}$ lb/nail
- number of webs, $N_{\text{web}} = \underline{2}$

Box Beams

Nails:

- 8d common
- allowable load per nail, $F_n = 74 \text{ lb/nail}$

Max Web Shear

$$F_v = V_h Q / I_b$$

$$V_h = (F_t t_w) I_t (N_{\text{webs}}) / Q_t$$

$$V_h = (81 \text{ lb/in}) 2800 \text{ in}^4 (2) / 139.5 \text{ in}^3$$

$$V_h = 3252 \text{ lbs.}$$

Max Nail Shear

$$V_n = F_n I_t (N_{\text{webs}}) (\text{Rows}) / (\text{spacing } Q_f)$$

$$V_n = 74 \text{ lb/nail} 2800 \text{ in}^4 / 2 / (1.5 \text{ in/nail} 110.25 \text{ in}^3)$$

$$V_n = 5011 \text{ lbs}$$

Stiffness

$$EI = E I_t = 1700000 2800 = 4,760,000,000.$$

Box Beams

Allowable Uniform Load (D+S)

Bending

$$M = w_b L^2 / 8 \quad SL \ 1.15$$

$$\underline{w_b} = M (C_D) 8 / L^2$$

$$\underline{w_b} = 16390 \text{ ft-lb} (1.15) 8 / (18 \text{ ft})^2 = 465 \text{ plf}$$

Web Shear

$$V_h = w_v L / 2 \quad 1.15 \ SL$$

$$\underline{w_v} = V_h (C_D) 2 / L$$

$$\underline{w_v} = 3252 \text{ lbs} (1.15) 2 / 18 \text{ ft} = 415 \text{ plf}$$

TABLE 413

Nail Shear

$$V_n = w_n L / 2 \quad 1.15$$

$$\underline{w_n} = V_n (C_D) 2 / L$$

$$\underline{w_n} = 5011 \text{ lbs} (1.15) 2 / 18 \text{ ft} = 640 \text{ plf}$$

Deflection

$$\Delta = 5(K_w L^4) / (384 EI)$$

$$\Delta = 5 (1.5) (415) (18)^4 (1728) / (384 4,760,000,000) = 0.31 \text{ } "$$

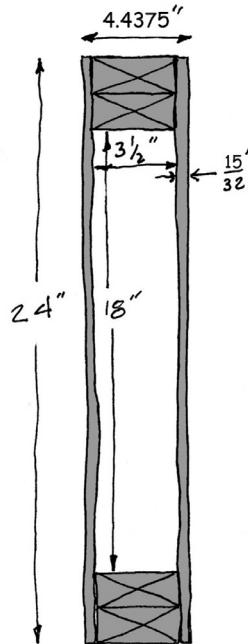

$$L/360 = 18(12)/360 = 0.6 \text{ } "$$

K factor for deflection in composite panel section (from APA testing)
for $L < 14 \text{ ft}$ $K = 2.0$, else $K = 1.5$

Slide 17 of 18

Box Beams

span: 8 ft depth: 12"
flanges: 2x4 S-P-F No2
webs: $\frac{1}{4}$ " 3-ply plywood
nails: 8d common at 3" o.c.

Capacity:

4000 lbs first cracking
8000 ft-lbs
5000 lbs ultimate
10000 ft lbs

Box Beams

Initial failure: web shear
further failure: nail pull out and head
pull through
ultimate failure: tension flange
